Title:
US-09-674-379A-13
Sequence:
2533
Sequence:
1 MPGIKRILTVTILALCLPSP......INFRGSSVIRLRIYVSQYPF 448
Scoring table:
BLOSUM62
Gapop 10.0, Gapext 0.5

Searched:
283224 seqs, 96134422 residues

Total number of hits satisfying chosen parameters:
283224
Minimum DB seq length: 0
Maximum DB seq length: 2000000000
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or remarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angioplasty (PTCA), or myoma, hematopoietic cell-regulatory activity, cytckine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity; tumor inhibition, and as nutrient. The present sequence represents the protein of the invention which can be used for modulating smooth muscle cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2000-038646/03.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or renarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angioplasty (PTCA), or myoma, hematopoietic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, cadohelin/tumour metastasis inhibiting activity tumor inhibition, and as nutrient. The present sequence represents the mature protein of the invention which can be used for modulating smooth muscle cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-NOV-1999

                                                                                                 The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or renarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angioplasty (PTCA), or myoma, hematopoletic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, cand coagulation/thrombotic activity; tumor inhibition, and as nutrient. The present sequence represents the protein of the invention which can be

The polypucleotides encoding these polypeptides are useful in the recombinant production of the polypeptides are useful in the recombinant production of the homologous sequences, or to map the gene. They may also be used for analysing genetic disorders, and to produce transgenic animals which are useful for the development and screening of therapeutically useful reagents. The polypuclectides can also be used in gene therapy e.g. to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         replace a defective gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating after percutaneous transuluminal coronary angioplasty (PTCA), or myoma, hematopoletic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, cadohelin/thenobotic activity; tumor inhibition, and as nutrient. The present sequence represents the mature protein of the invention which can be used for modulating smooth muscle cell proliferation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.

Isolated nucleic acid molecule encoding transmembrane polypeptide is useful for of related polypeptides a PRO polypeptide which is gene therapy and identifica identification

Claim 12; Fig 10; 244pp; English.

The present sequence represents a human secreted and transmembrane polypeptide. The specification describes human polypeptides, designated pR0196, pR0444, pR0183, pR0185, pR0210, pR0215, pR0217, pR0242, pR0286, pR0365, pR01361, PR01183, PR01272, pR0419, pR04999, PR07170, pR0248, pR0353, pR01318, pR01600, pR09940, pR0533, PR0301, pR0187, pR0337, pR01411, pR04356, pR0246, pR0265, pR0941, pR010096, pR06003, pR06004, pR0350, pR02630 and pR06309. The biological activity of cells

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate animal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            least 95% identical with a sequence (ATCC 97285) encoding mature human extracellular protein-like/epidermal growth factor (EGF)-like protein, EEGF. Also included are the EEGF EGF domains, a vector containing the polynucleotide, a host cell containing the vector, anti-EEGF antibodies and antagonists of EEGF. The polynucleotide is used for recombinant production of EEGF, in gene therapy, as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel polynucleotide which is at least 95% identical with a sequence (ATCC 97285) encoding m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 10; Fig 1; 22pp; English.

Sjogren's syndrome, systemic vascuitor, paroxysmal hemolytic anemia (immune pancytopenia, paroxysmal hemoglobinuria), autoimmune thrombocytopenia (idio hemoglobinuria), autoimmune thrombocytopenia), thyroid
                                                                                             This invention describes a novel composition containing (apart from a carrier or exciplent), a novel PRC245 polypeptide (I), its agonist or antagonist, or their fragments, for modulating: (i) infiltration of inflammatory cells into tissue; (ii) an immune response; or (iii) T cell proliferation. The composition increases or decreases any of the effects (i)-(iii). The products of the invention have anti-inflammatory, anti-autoimmune and anti-diabetic activity. (I), and its (ant)agonists and their fragments, are used to treat immune related diseases, particularly T cell-mediated diseases. The diseases treated include systemic lupus erythematosus, rheumatoid arthritis, juvenile chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  anti-inflammatory; anti-autoimmune; anti-diabetic; spondyloarthropathy; T cell-mediated disease; spondyloarthropathy; sclerosis; renal disease; inflammatory myopathy; hemolytic anemia; thrombocytopenia; thyroiditis; diabetes mellitus; demyelinating polyneuropathy; Guillain-Barre syndrome; multiple sclerosis; polyneuropathy; hepatitis; cirrhosis; enteropathy; sclerosing cholangitis; inflammatory bowel disease; Whipple's disease; skin disease; dermatitis; psoriasis; asthma; allergic rhinitis; tumor; food hypersensitivity; urticaria; eosinophilic pneumonia; transplant; diopathic pulmonary fibrosis; graft rejection; PRO245; human; PRO217;

                                                                                                                                                               clones. 830 cDNA molecules encoding a human protein have been 1solated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              08-JUL-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC polynicleotide sequence was obtained from a human foctal kidney cDNA CC library. AK647 homologues in chicks and rodents are involved in aortic tissue development. The spatial and temporal distribution of AK647 CC indicated that it acts as an a modulator of smooth muscle cells in CC vasculogenesis during embryonic development. The primary structure of AK647 consists of multiple EGF domains. The AK647 protein can be used as a nutritional source or supplement. The protein shows both inhibitory and CC inducing, cytokine, cell proliferation and cell differentiation activity. The protein may also be used in the treatment of immune deficiencies and cother viral, bacterial and fungal infections. Regulation of immune controlled the protein include a role in the regulation of haematopoises and in the treatment of myeloid and lymphoid cell deficiencies. Uses in bone, cartilage, tendon, ligament and nerve tissue regrowth are also possible, as well as for wound healing and in the treatment of ulcers and burns. The polynucleotides and proteins can be used for preventing, treating or ameliorating smooth muscle cell growth, vasculogenesis, restenosis, catheroscierosis, blood vessel remodelling and degeneration. The proteins may also have activin/inhibin, chemotactic/chemokinetic, haemostatic and thrombolytic, receptor/ligand, anti-inflammatory, cadherin/tumour controlled can be used for promoting smooth muscle cell growth or vasculogenesis. The proteins and polynucleotides can also be used for detection. disconsis and dim users and burns are proteins and proteins and proteins can be used for beautiful and be used for detection. The proteins and consistency and tumour inhibition activity. AK647 specific contences and burns are proteins and proteins and proteins can be used for detections and so be used for detection.

                                                                                                                                                                                                                                                                                                                                                       This sequence is the human A55 protein of the invention. The protein can be used for the treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be used according their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or re-narrowing by vascular endothelial thickening after percutaneous transluminal coronary angioplasty (PTCA), or myoma, haematopoletic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actino/inhibin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, cadherin/tumour metastasis inhibiting activity; tumour inhibition, and as a nutrient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A55 protein; human; smooth muscle proliferation; tissue generation; vascular smooth muscle cell; arteriosclerosis; tissue reparation; myoma; vascular endothelial thickening; haematopoietic cell-regulator; cytokine; percutaneous transluminal coronary angioplasty; blood coagulation; PTCA; actin; inhibin; chemotaxis; thrombosis; cadherin; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC factor-like protein, EEGF. This protein can be used to regulate consciously shown as call ar smooth muscle cell proliferation and for restoration or cenhancement of neurological functions diminished as a result or other cd damaging pathologies such as AIDS dementia. The protein can also be used to treat senile dementia, ocular disorders such as corneal inflammation, cfor treating tumour cells, for treating kidney disorders, for liver consistent of the corneal inflammation, for treating tumour cells, for treating kidney disorders, for liver consistent of the condition, for treating wounds including call cutaneous wounds, corneal wounds, and injuries to the cepithelial-lined hollow organs of the body or resulting from trauma such as burns, abrasions and suits as well as from surgical procedures such as surgical incisions and skin grafting. The polypeptides can also be used condital incisions and skin grafting. The polypeptides can also be used conditions, such as chronic ulcers, diabetic ulcers, other non-healing (trophic) conditions, to treat Marfan syndrome, to commote hair follicular development, to stimulate growth and conditions and to stimulate embryogenesis. Antagonists to EEGF can be used to treat neoplasia such as cancers or tumours, skin disorders such as corneal inflammation. The products can also be used for identifying EEGF receptors, detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FT FT XXX FT FT FT FT FT FT FT FT XXX FT FT XXX FT

                                                                                                                                                                                                                The sequence is that of a secreted protein from a human fetal kidney clone AK296. Such a sequence is predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haemostatic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, and tumour invasion suppressor activity, and tumour inhibition activity. It is also stated to be useful for gene
                                                                                                                                Sequence
